

Precise drive and measurement technology.

Variant production with serial quality

We are experts in intelligent, mechatronic drives for adjusting formats in machines, as well as measuring the smallest pressures in gases. And we have been doing so for over 75 years.

Our particular expertise lies in developing solutions for your individual application and delivering them in serial quality. Starting from a batch size of one.

Quality and timing over cost

We are not in favor of „quick and dirty“. We focus on quality. And on sustainability.

We consider every error we discover to be a learning opportunity that helps us improve. With our certified quality and environmental management system, we ensure that we meet our high standards as well as yours. Without compromise.

Lean since 2009

Resources are precious and waste is expensive. That's why we have been practicing the lean management approach for more than a decade.

We are committed to becoming better every day through established processes and regular audits that challenge us. This also helps us maintain competitive costs, and as our customer, you benefit from our efficiency.

Focus on customers

Your construction is unique? So are our solutions. With our engineering skills and expertise, we create the optimal product for you.

Our mechanical design, electronic development, software programming, and manufacturing teams work closely together under one roof to ensure seamless collaboration. All of our solutions are made in Germany.

Team and culture

We stand for German precision and innovation. In doing so, we live by our values of open communication, teamwork, economic efficiency and sustainability.

We believe in excellent processes, and even more in dedicated people. As a family-run company, our goal is to leave the company better in every sense than it was taken over by the generation before.
